

Jonathan Li

(858) 527-8696 | Berkeley, CA | johnnylii@berkeley.edu | <https://linkedin.com/in/jonathanli1> | jonathanli.xyz

EDUCATION

University of California, Berkeley
Bachelor's of Arts, Applied Mathematics and Computer Science

Expected Graduation: June 2027
Berkeley, CA

- Relevant Coursework: Data Structures & Algorithms, Artificial Intelligence, Real Analysis, Abstract Algebra, Linear Algebra, Discrete Mathematics, Multivariable Calculus

WORK EXPERIENCE

SWE Intern
Apple

May 2026 — Present
Cupertino, CA

- Engineering Python and C++ pipelines to parse crash logs, classify failure modes, and dispatch targeted repair agents across device fleets.
- Building an agent-based system to automatically triage errors and crashes on devices, proposing solutions and validating fixes on virtual machines in an iterative loop.
- Architecting VM-based testing infrastructure to validate proposed fixes in isolated environments before deployment, reducing manual debugging overhead.

Strategic Product Management Intern
Scale AI

June 2025 — August 2025
San Francisco, CA

- Drove \$30M/quarter in client model support by building NumPy/Pandas pipelines to analyze failure areas and produced Seaborn visuals that shaped client roadmaps.
- Increased model performance by up to 22% for a key client by diagnosing subject-area weaknesses and identifying targeted dataset improvements.

Data Analytics Intern
Airspace Technologies

May 2024 — August 2024
San Diego, CA

- Developed and optimized SQL algorithms for large-volume freight shipping cost estimation, driving \$400K in projected annual savings.
- Automated ingestion and revision of 10M+ rows into Snowflake, streamlining data integration and analytics workflows.

RESEARCH

Undergraduate Researcher
Stanford Artificial Intelligence Lab (SAIL)

July 2025 — Present
Berkeley, CA

- Fixed outcome-misreporting and timestamp-collapse bugs in the benchmark runner by rewriting outcome derivation to inspect agent status and evaluation scores, moving timestamp capture to per-turn Docker stream time, and adding inconsistency detection.
- Architected end-to-end integration of a federated service into a mobile cybersecurity benchmark: authored Docker Compose stacks (API, PostgreSQL, Redis), configured HTTPS with self-signed certificates, and resolved networking across emulator, agent, and backend containers.
- Built Python probe suites to programmatically verify vulnerability presence/absence across token leakage, credential exposure, API access control, and password hash verification.

PROJECTS

EPSAL: CPR Education Gap Analysis (github.com/jonathanli1/CPR-CA-DA)

Feb 2025

- Built Python/Jupyter pipelines identifying that 40.1% of CA high school students lack CPR education access, mapping disparities across 186 districts to legislative districts to support advocacy for SB 945.

SKILLS

- Languages:** Python, C/C++, Java, JavaScript, Bash, SQL
- Frameworks & Tools:** Docker, Git, UNIX, NumPy, Pandas, PyTorch, NGINX, Google Cloud Platform
- Systems:** Distributed Systems, VM Infrastructure, Containerization, Performance Profiling, Data Pipelines
